User manual M3-1F

Frequency input: 0.01 Hz to 999.99 kHz / 0.01 Hz to 9.9999 kHz / 0-2.500 kHz

Connection for Namur, NPN/PNP with HTL- or TTL-output or for position survey via incremental encoder

Technical features:

- red display of -19999...99999 digits (optional: green, orange or blue display)
- minimal installation depth: 120 mm without plug-in terminal
- · min/max memory
- adjustment via factory default or directly on the sensor signal
- 30 adjustable setpoints
- · display flashing at threshold undercut or exceedance
- simplified programming r.p.m. with only 3 parameters
- Schmitt-trigger-input
- zero-key for triggering of Hold, Tara
- permanent min/max-value recording
- digital frequency filter for contact bounce suppression and interference suppression
- frequency filter with varying pulse-duty factor
- volume metering (totaliser) for frequencies up to 1 kHz (accurate to a pulse)
- mathematical function like reciprocal value, square root, rounding
- sliding averaging with an optional dynamic display filter
- · setpoint generator
- brightness control
- programming interlock via access code
- protection class IP65 at the front
- · plug-in terminal
- sensor supply
- galv. isolated digital input
- option: 2 or 4 relay outputs or 8 PhotoMos outputs
- option: 1 or 2 analog outputs
- option: interface RS232 or RS485
- accessories: PC-based configuration-kit PM-TOOL incl. CD & USB-adapter for devices without keypad and for a simple adjustment of standard devices

1. Brief description

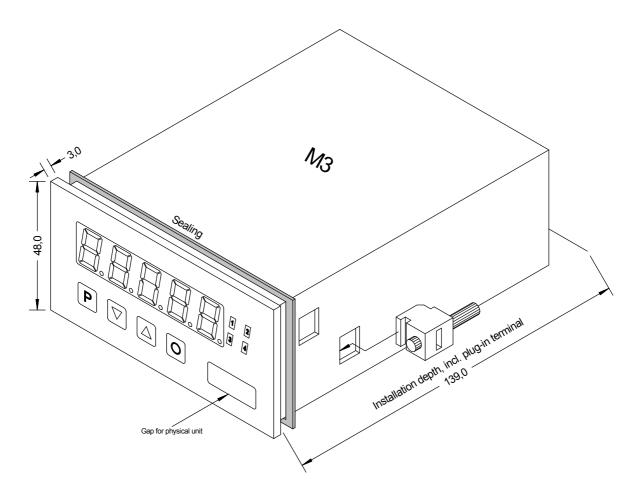

The panel meter **M3-1F** evaluates pulses in many different ways and shows the result in the 5-digit LED-display. Available options are: frequency coverage with optional filters, summate of pulses or display values via time, detection of a rotational speed or collection of a position via an incremental encoder. The results can be monitored via alarm conditions and can be displayed onto the optional switching point. Furthermore the results can be freely scaled on an optional analog output and relayed to a control system. The device can be operated directly by Namur sensors, 3-wire sensors, switching/slider contacts, incremental encoders (HTL-/TTL-output) or TTL-signals.

Via the 4 navigation keys on the front, the device can be adjusted onto different kind of applications and later on different functions of the device can be controlled. The adjustment is also possible via the PC-Software PM-TOOL with a special connecting cable. With an individual code, the created parameterisation can be protected against changes of the user.

Numerous applications can be realised with this device, like e.g. tachometer, revolution counter, flowmeter, dosing equipment, filling capacity meter, baking time meter of a baking oven, flying knife, position evaluation, position surveillance, flow rate surveillance, acoustic discharge measurements and so on. By use of the integrated, configurable functions like permanent min/max-recording, averaging, frequency filter, setpoint setting, threshold value recording via alarm system, 30-points-linearisation, mathematic charging and many more, you receive an universal applicable modern system for your demands in measuring and control technique.

2. Assembly

Please read the *Safety advices* on *page 39* before installation and keep the user manual for future reference.

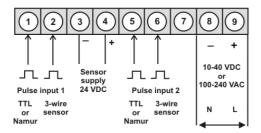

- 1. After removing the fixing elements, insert the device.
- 2. Check the seal to make sure it fits securely.
- 3. Click the fixing elements back into place and tighten the clamping screws by hand. Then use a screwdriver to tighten them another half a turn.

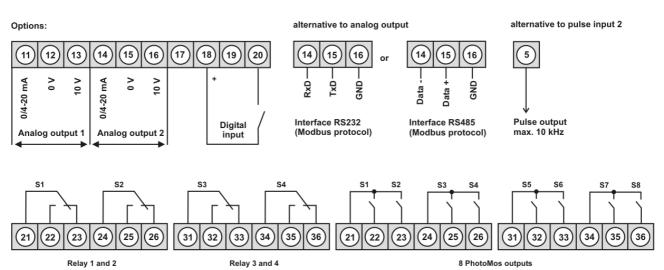

CAUTION! The torque should not exceed 0.1 Nm!

The dimension symbols can be exchanged before installation via a channel on the side!

3. Electrical connection

Type M3-1FR5B.0307.S70BD supply 100-240 VAC, DC ± 10% **Type M3-1FR5B.0307.W70BD** supply 10-40 VDC, galv. isolated, 18-30 VAC

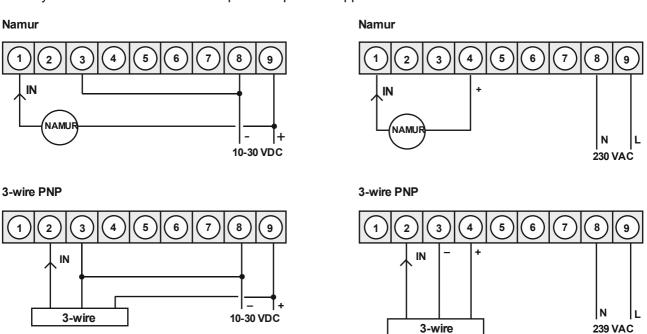

Advice:

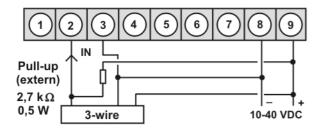

If Namur sensors with a nominal voltage of approx. 8 V are used, then a sensor supply of 12 VDC is needed. For devices with a sensor supply terminals 4 and 18, aswell as terminals 3 and 19 need to be galvanically connected in the device.

Connection examples

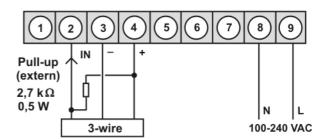

Below you find some connection examples with practical applications:

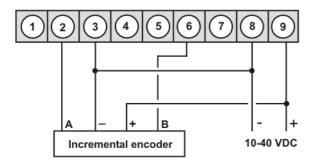

3-wire NPN

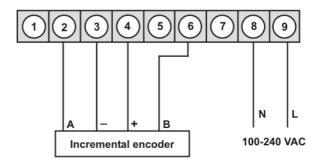

3-wire NPN

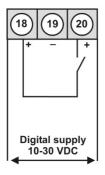

Incremental encoder

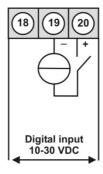

Incremental encoder (max. 50 mA current consumption)

M3 with digital input in combination with 24 VDC sensor supply

M3 with digital input and external voltage source

4. Function and operation description

Operation

The operation is divided into three different levels.

Menu level (delivery status)

This level was designed for the standard settings of the device. Only menu items which are sufficent to set the device into operation are displayed. To get into the professional level, run through the menu level and parameterise **PROF** under menu item **RUN**.

Menu group level (complete function volume)

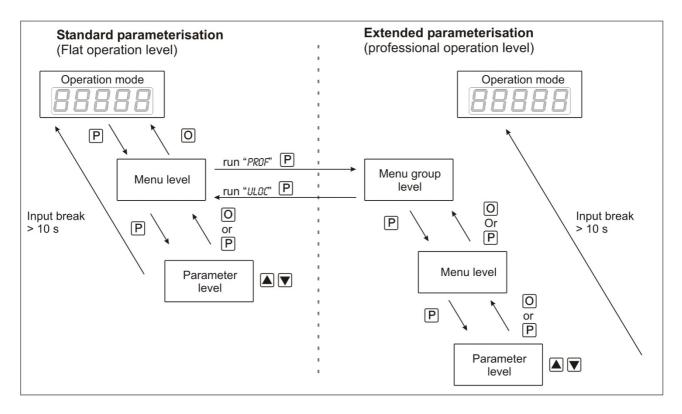

Suited for complex applications as e.g. linkage of alarms, setpoint treatment, totaliser function etc. In this level function groups which allow an extended parameterisation of the standard settings are availabe. To leave the menu group level, run through this level and parameterise **ULDC** under menu item **RUN**.

Parameterisation level:

Parameter deposited in the menu item can be parameterised here. Functions, that can be changed or adjusted, are always signalised by a flashing of the display. Settings that are made in the parameterisation level are confirmed with **[P]** and thus saved. Pressing the **[O]-key** ("zero-key") leads to a break-off of the value input and to a change into the menu level. All adjustments are saved automatically by the device and changes into operating mode, if no further key operation is done within the next 10 seconds.

| Level | Key | Description |
|------------------------|-----|--|
| | Р | Change to parameterisation level and deposited values. |
| Menu level | | Keys for up and down navigation in the menu level. |
| | 0 | Change into operation mode. |
| | Р | To confirm the changes made at the parameterization level. |
| Parameterisation level | | Adjustment of the value / the setting. |
| | 0 | Change into menu level or break-off in value input. |
| | Р | Change to menu level. |
| Menu group level | | Keys for up and down navigation in the menu group level. |
| | 0 | Change into operation mode or back into menu level. |

Function chart:

Underline:

- O Stop ▼ Value selection (-)

4.1. Parameterisation software PM-TOOL:

Included in the delivery of the PM-TOOL are the software on CD and an USB-cable with device adapter. The connection happens via a 6-pole micromatch-plug on the back side of the device, to the PC-side the connection happens via an USB plug.

System requirements: PC incl. USB interface Software: Windows XP, Windows VISTA

With this tool the device configuration can be generated, omitted and saved on the PC. The parameters can be changed via the easy to handle program surface, whereat the operating mode and the possible selection options can be preset by the program.

5. Setting up the device

5.1. Switching-on

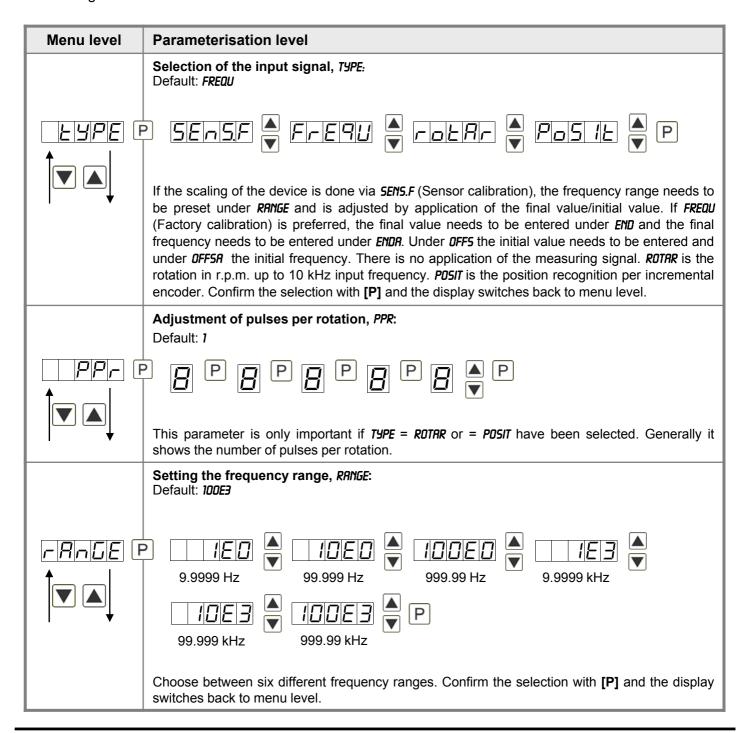

Once the installation is complete, start the device by applying the voltage supply. Before, check once again that all electrical connections are correct.

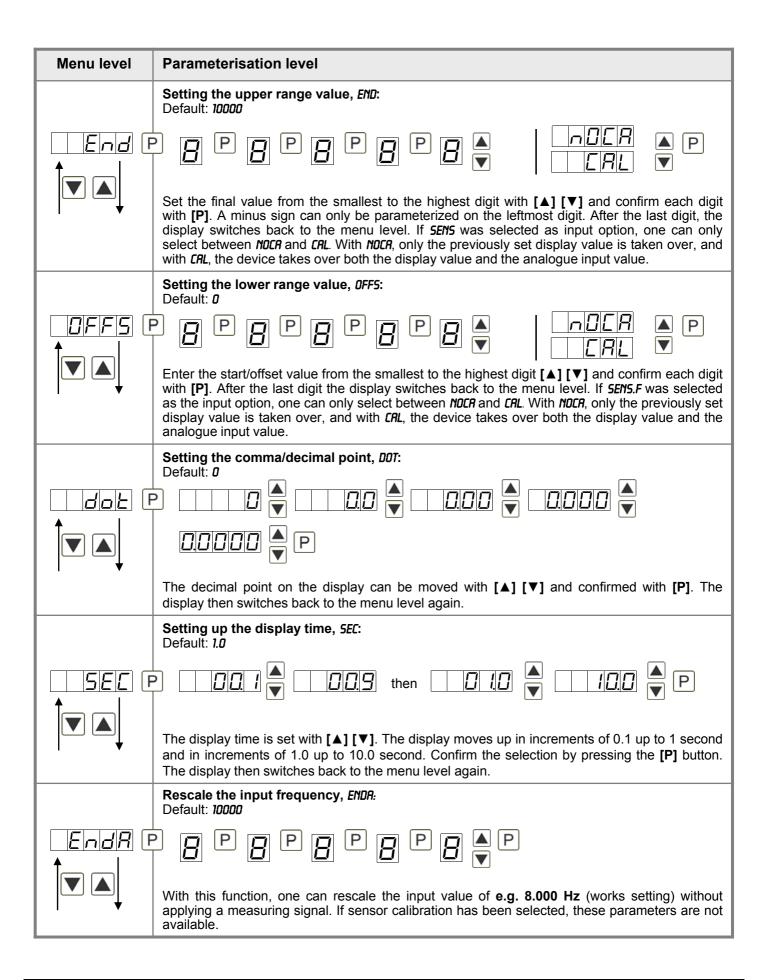

Starting sequence

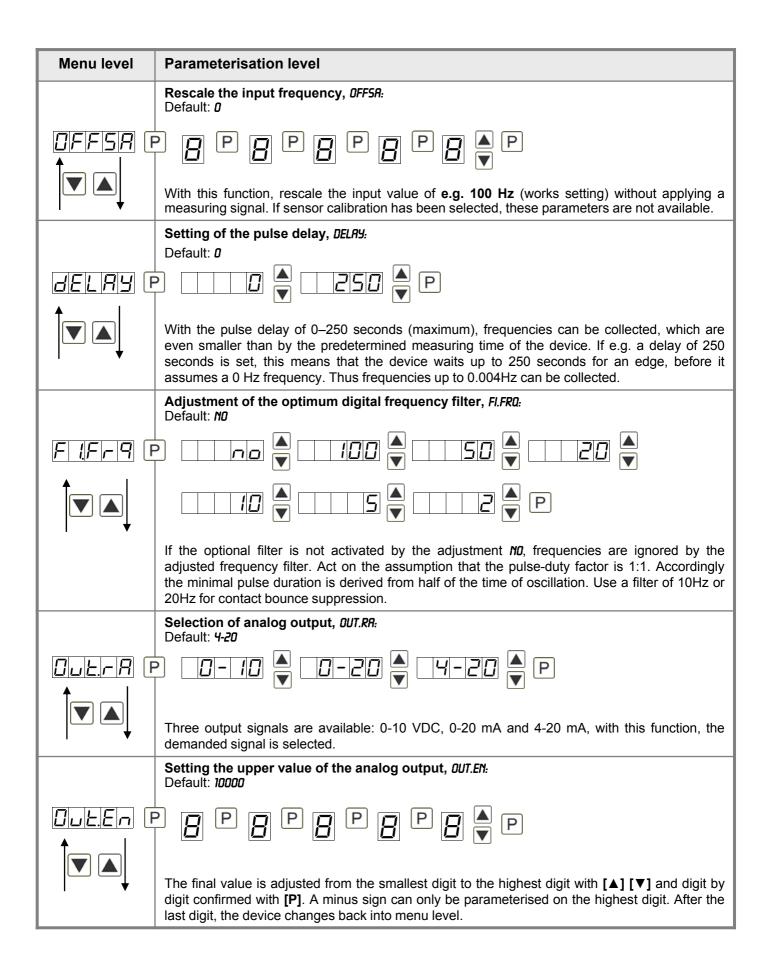

For 1 second during the switching-on process, the segment test (**B B B B B**) is displayed, followed by an indication of the software type and, after that, also for 1 second, the software version. After the starting sequence, the device switches to operation/display mode.

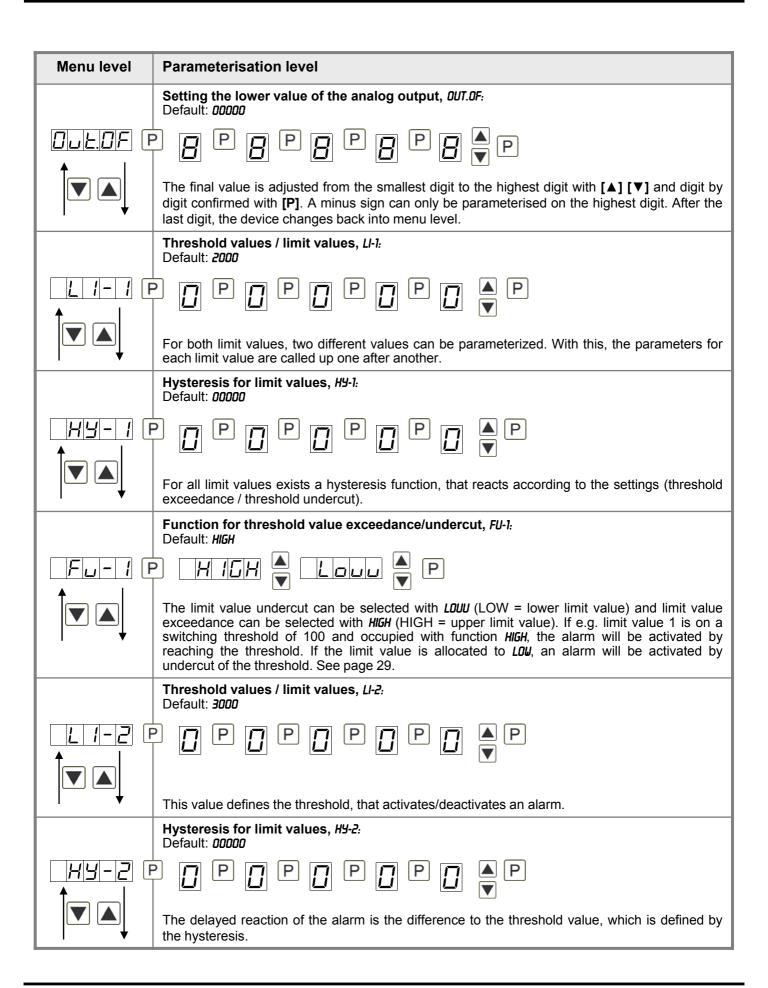

5.2. Standard parameterisation: (flat operation level)

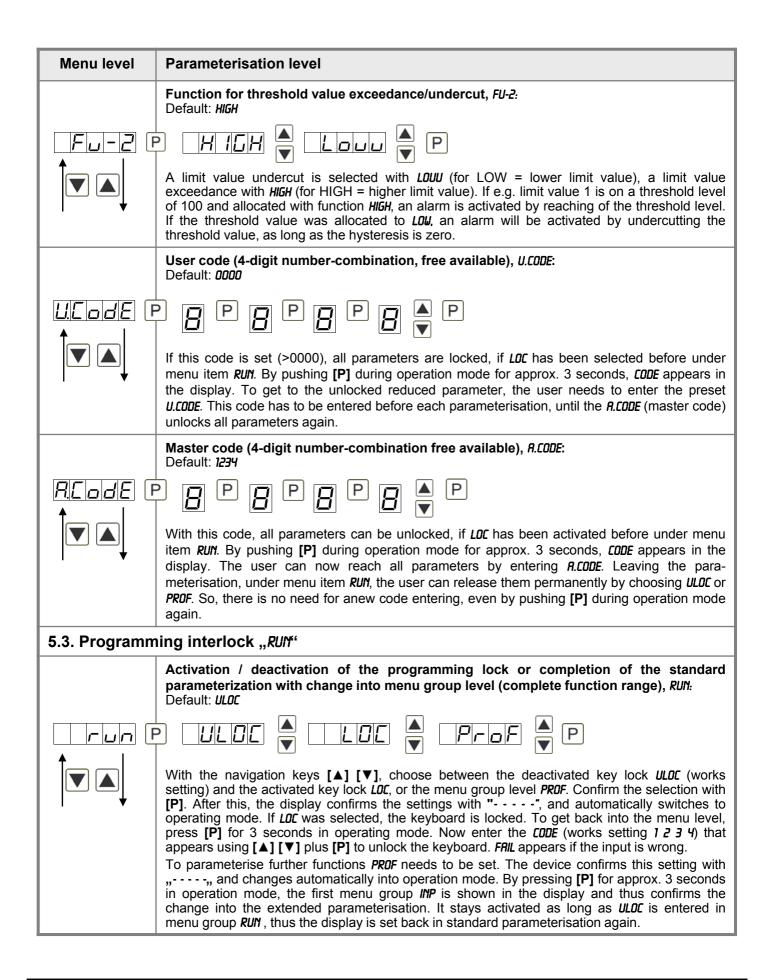

To parameterize the display, press the **[P]-key** in operating mode for 1 second. The display then changes to the menu level with the first menu item **TYPE**.

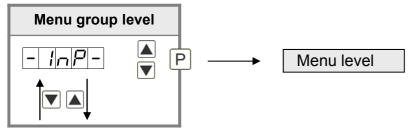

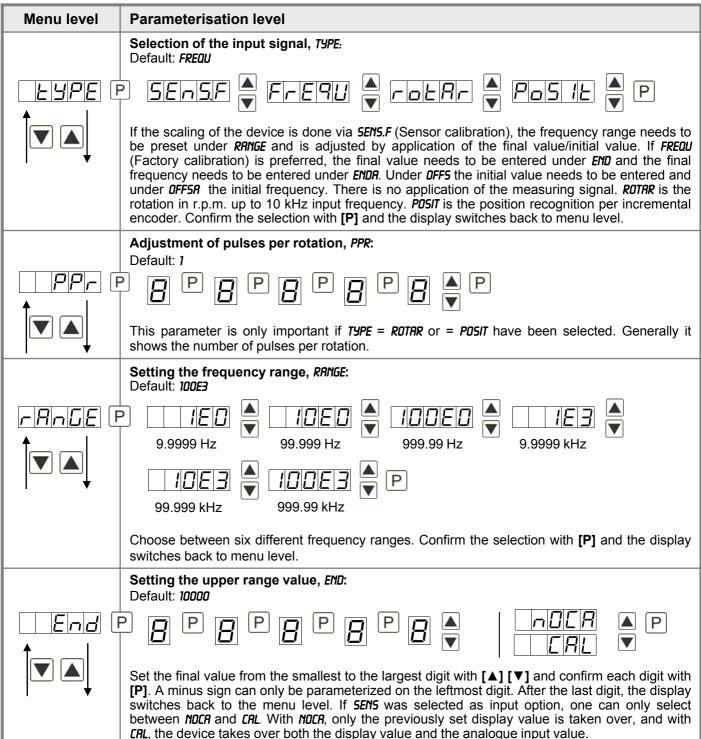

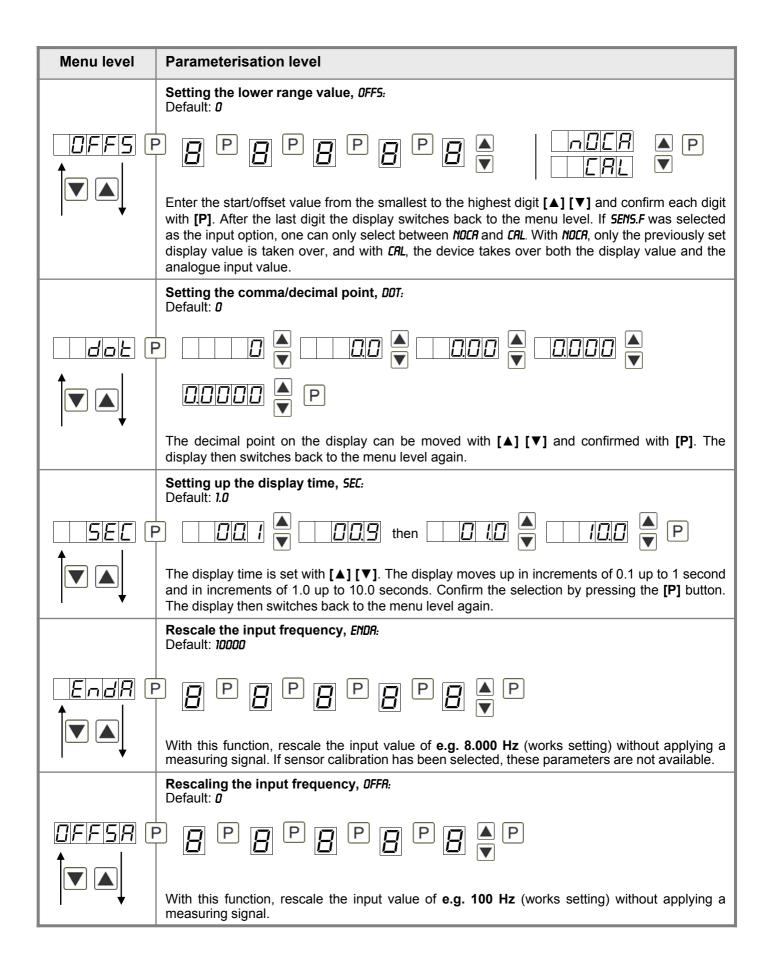

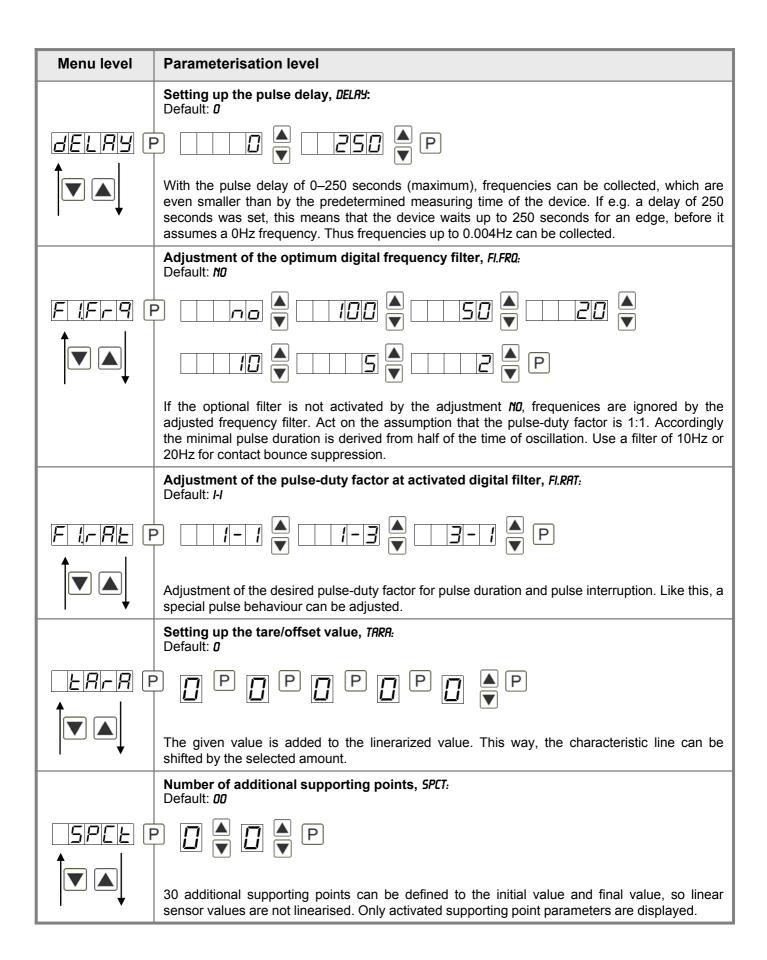

5.4. Extended parametrisation (Professional operation level)

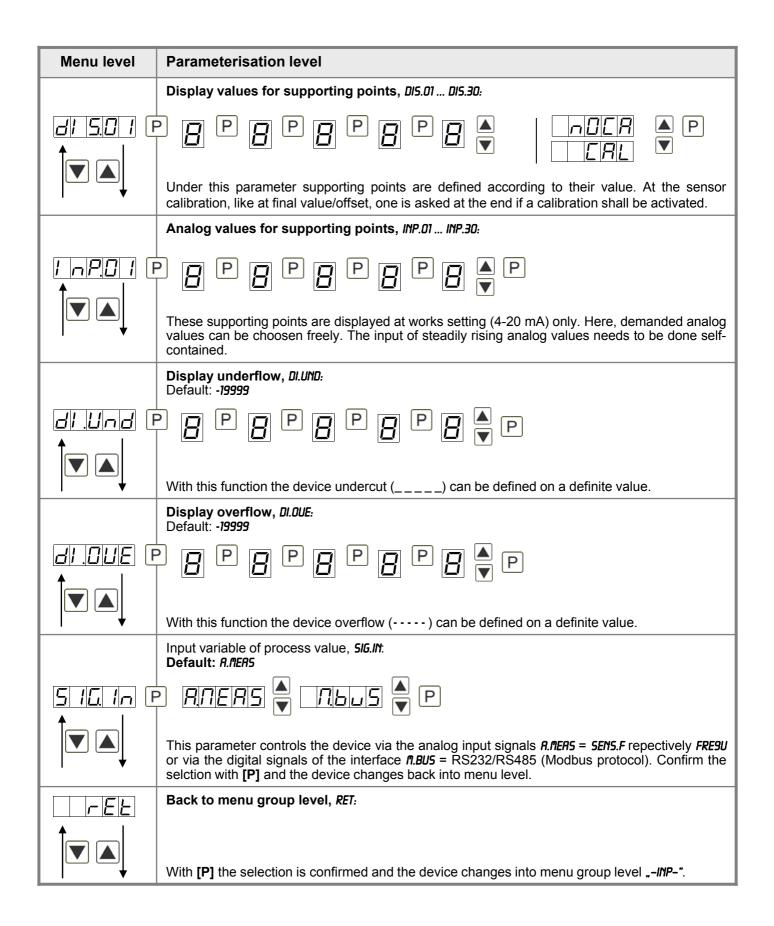

5.4.1. Signal input parameters

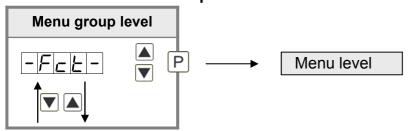

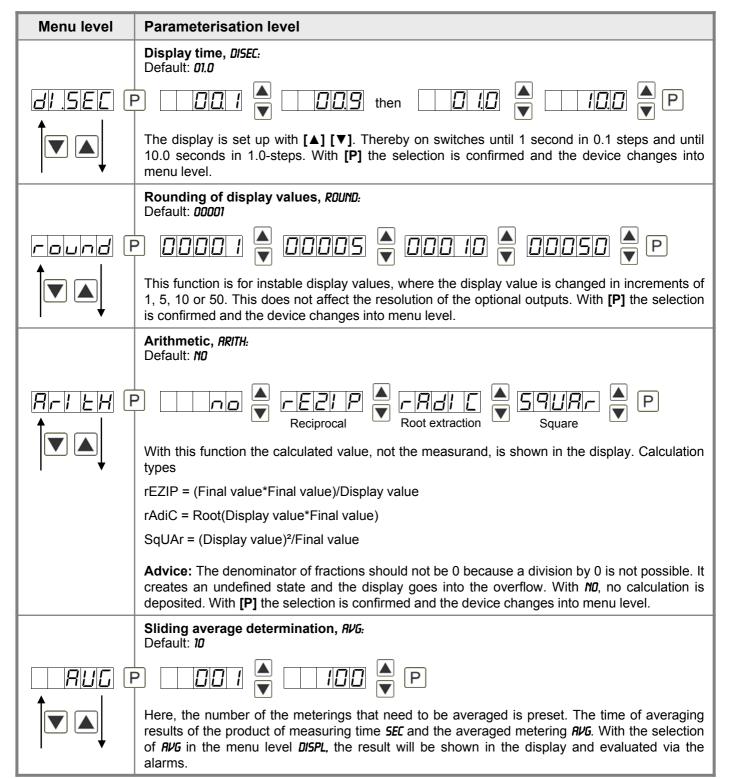

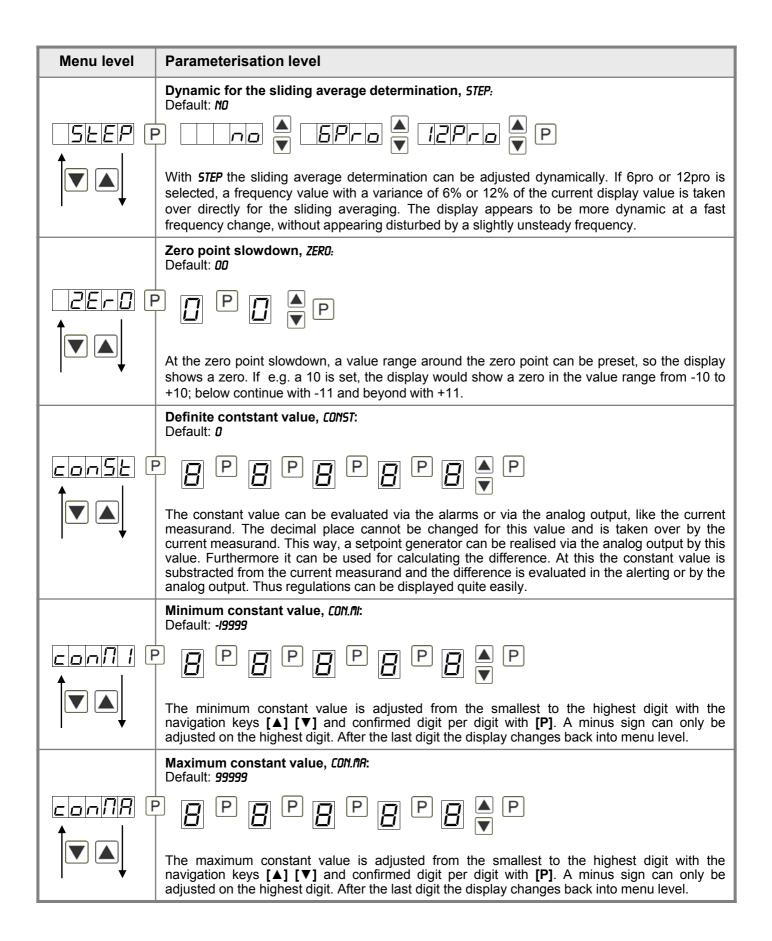

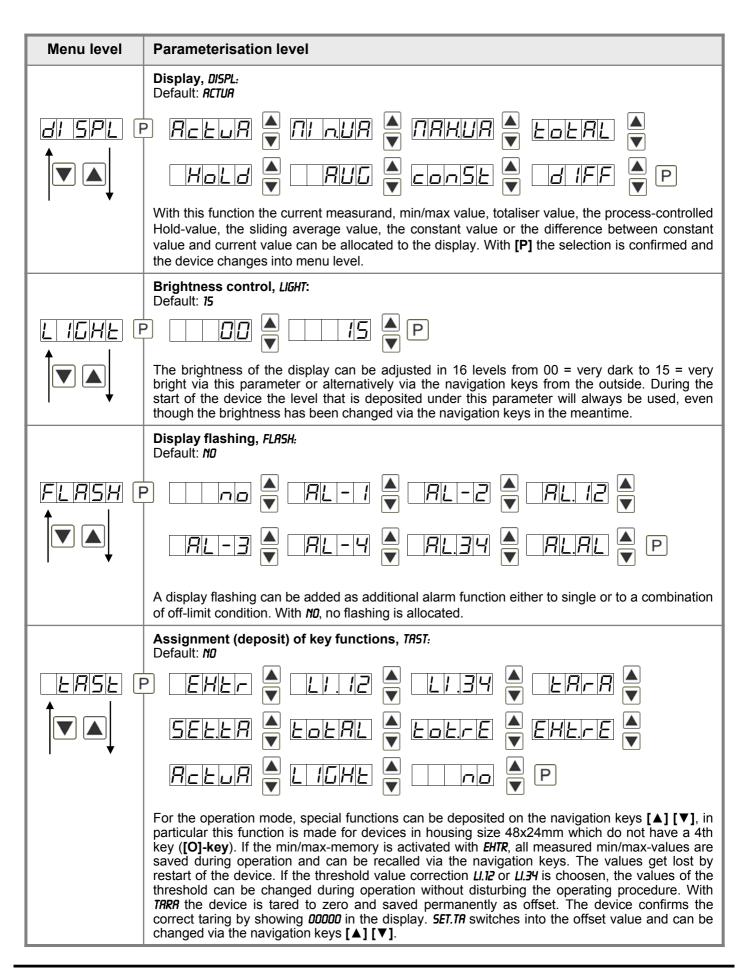

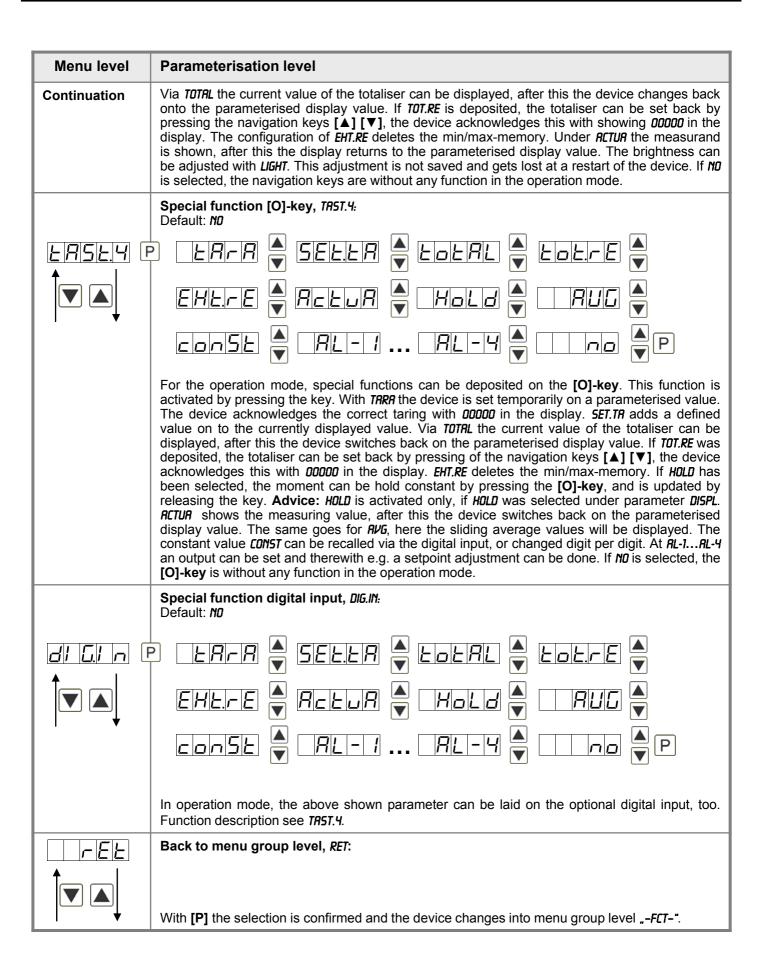

5.4.2. General device parameters

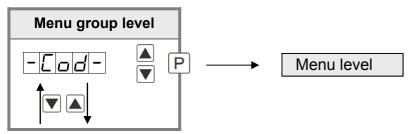

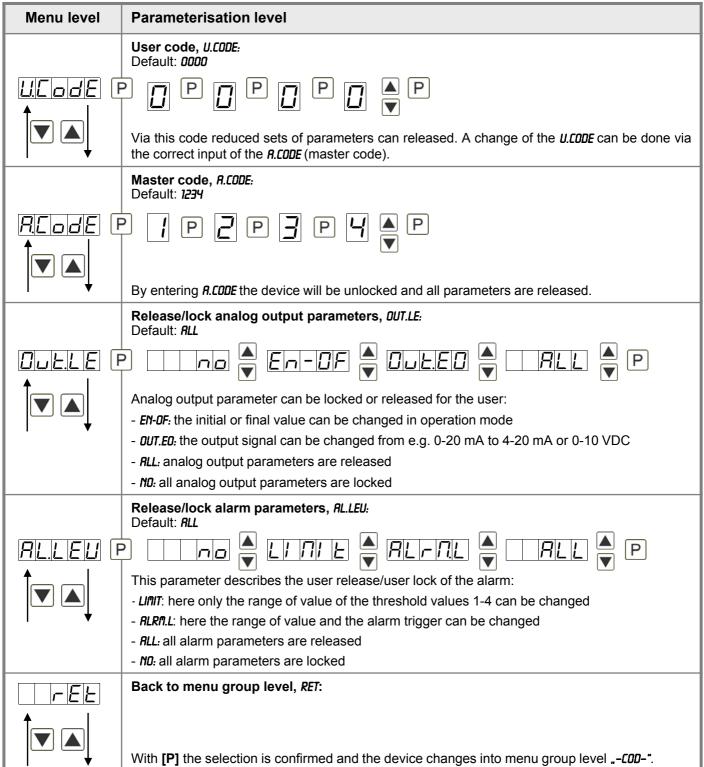

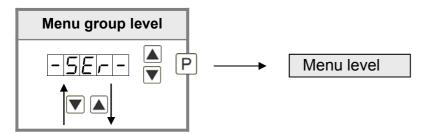

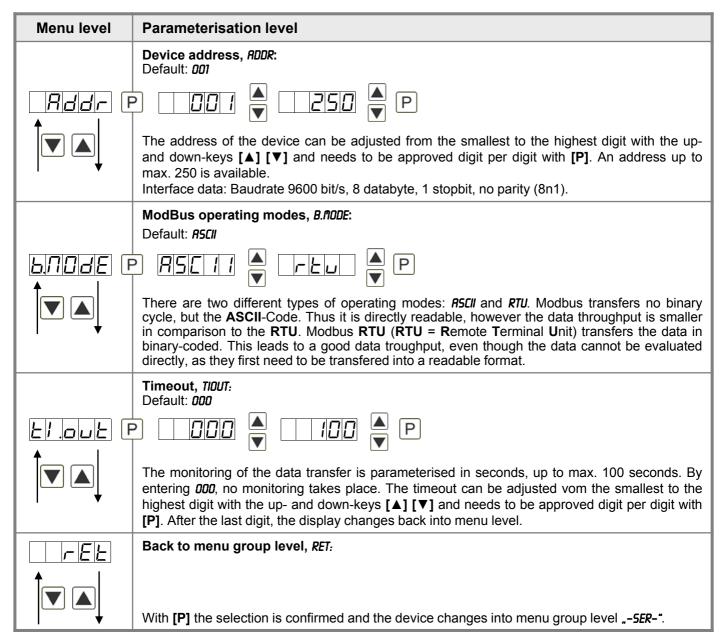

5.4.3. Safety parameters

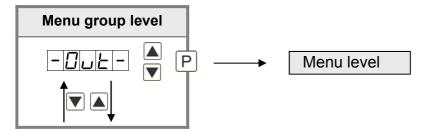

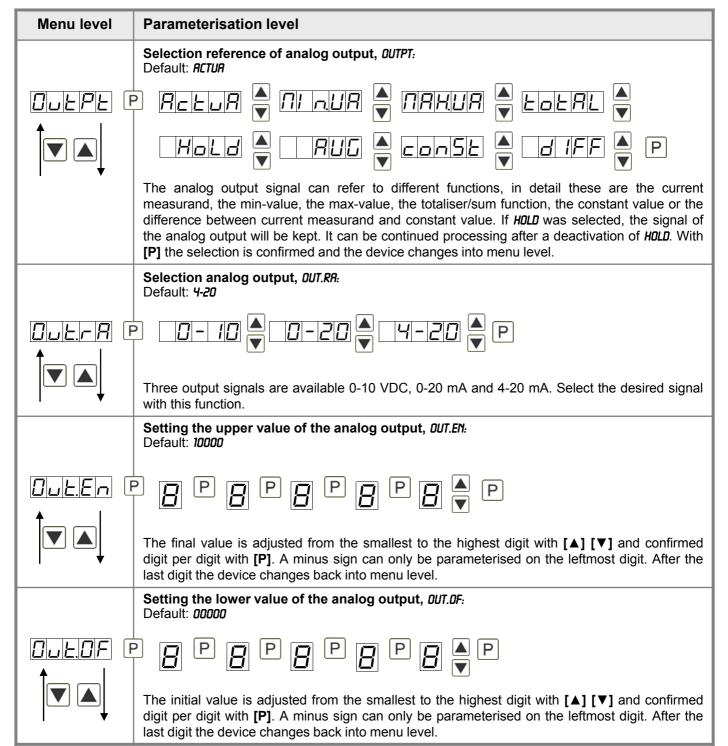

5.4.4. Serial parameters

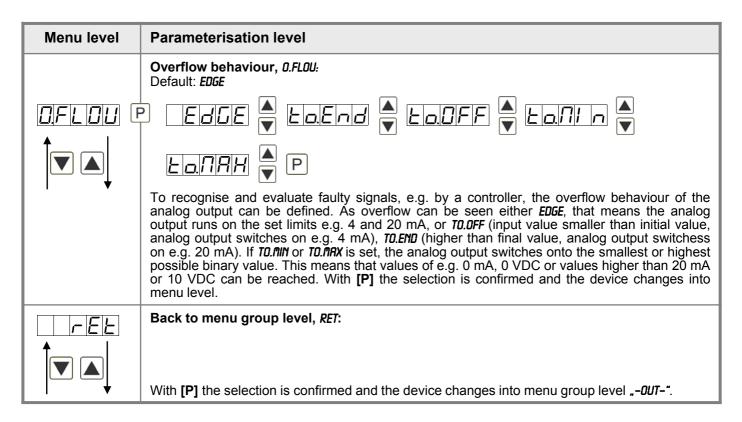

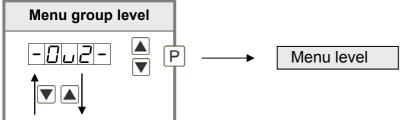

5.4.5. Analog output parameters 1

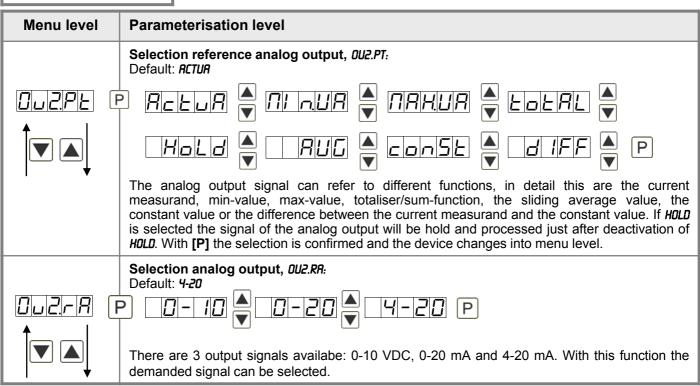

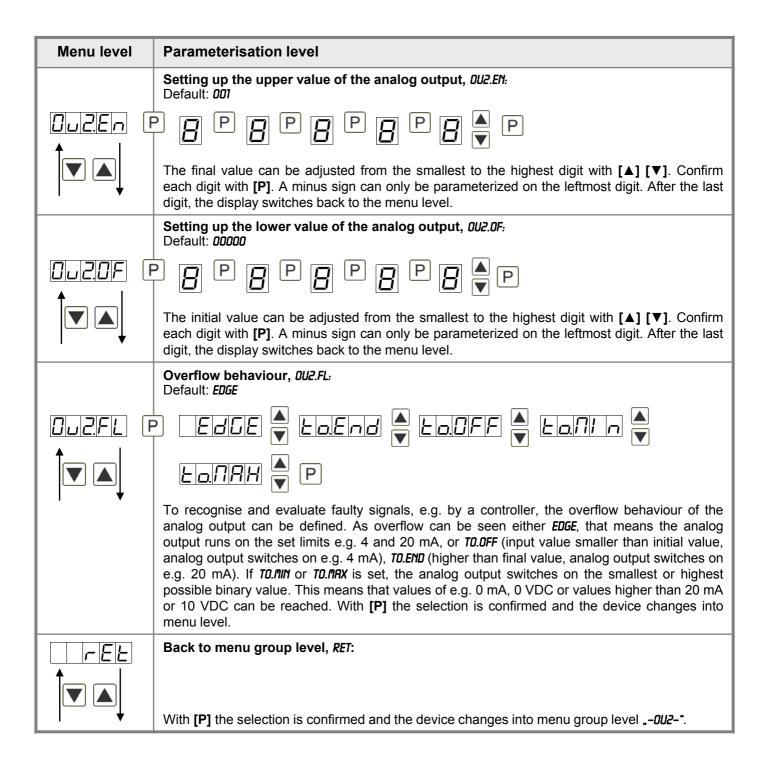

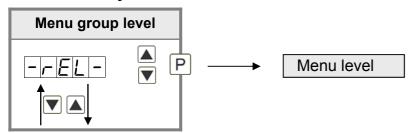

Analog output parameters 2

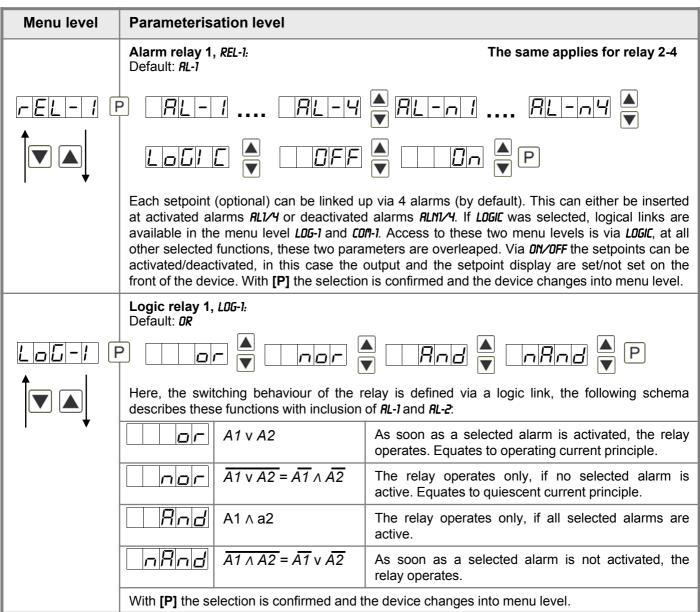

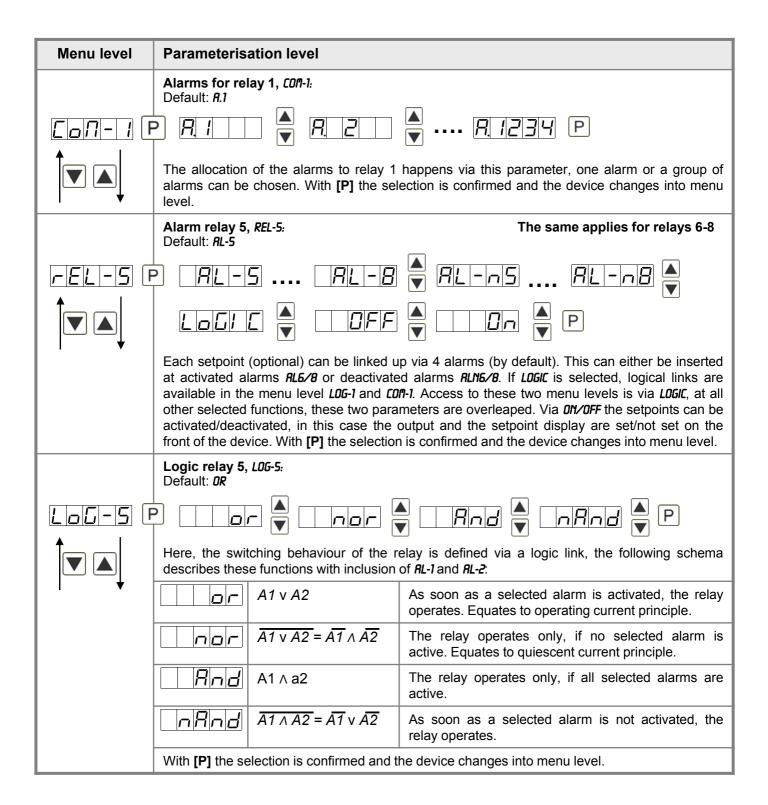

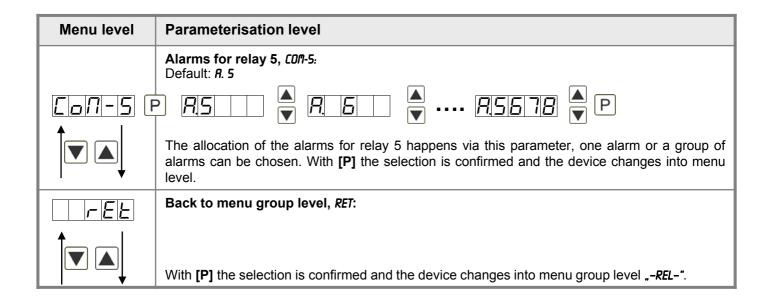

5.4.6. Relay functions

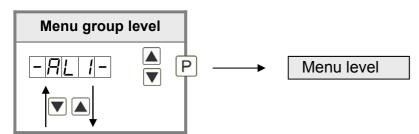

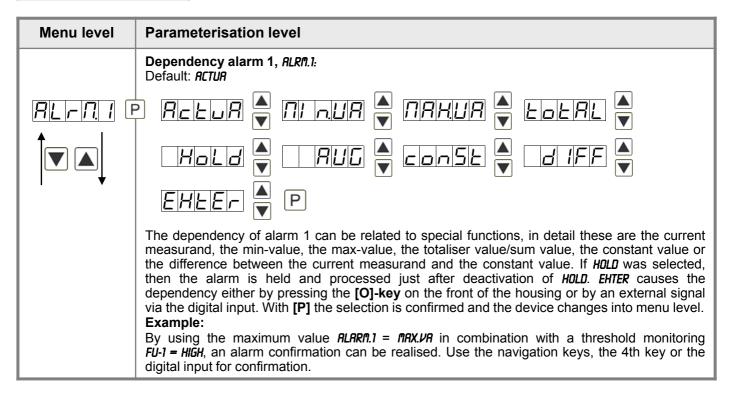

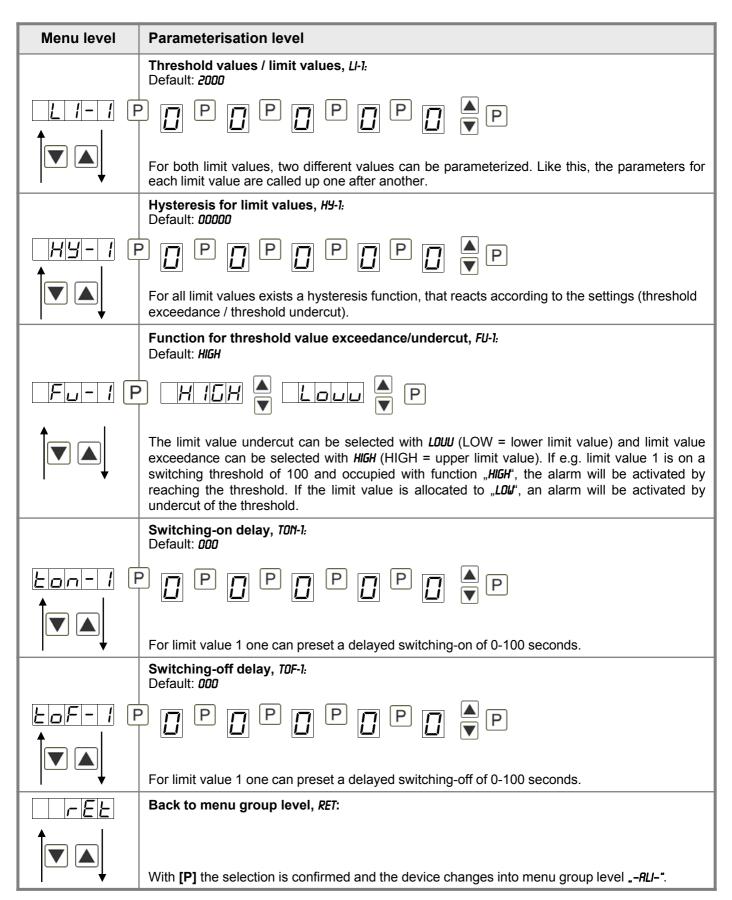

5.4.7. Alarm parameters

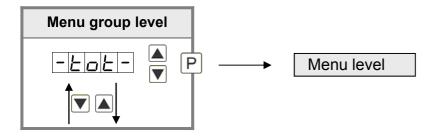

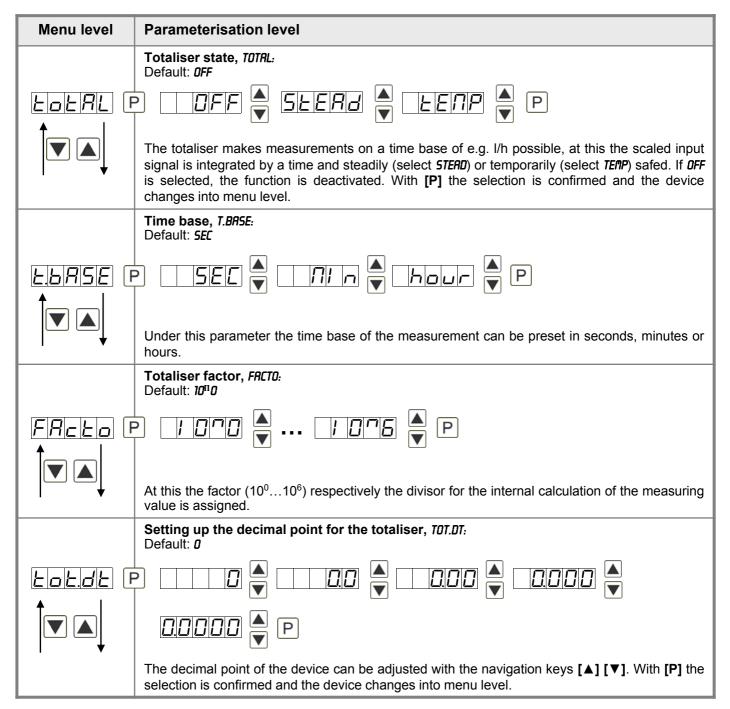

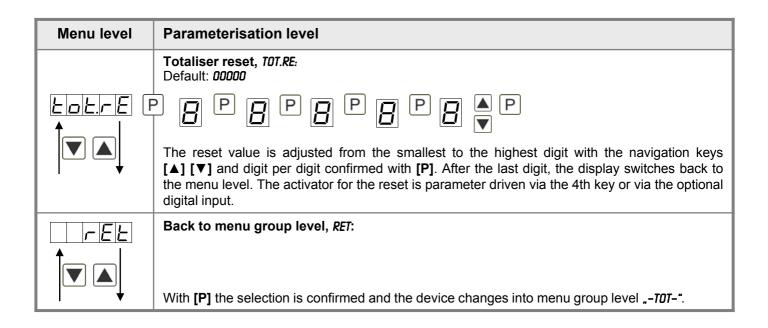

The same applies to -AL2- to -AL8-.

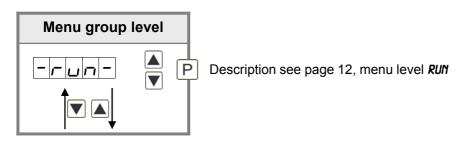

5.4.8. Totaliser (Volume measurement)

Programming lock, RUM:

6. Reset to factory settings

To return the unit to a **defined basic state**, a reset can be carried out to the default values. The following procedure should be used:

- · Switch off the power supply
- Press [P] button
- Switch on voltage supply and press [P]-button until "----" is shown in the display.

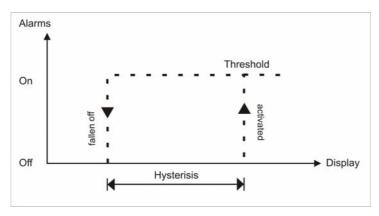

With reset, the default values of the program table are loaded and used for subsequent operation. This sets the unit back to the state in which it was supplied.

Caution! All application-related data are lost.

7. Alarms / Relays

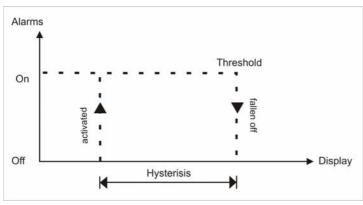

This device has 4 virtual alarms that can monitor one limit value in regard of an undercut or exceedance. Each alarm can be allocated to an optional relay output S1-S4; furthermore alarms can be controlled by events like e.g. hold or min/max-value.

| Function principle of alarms / relays | | | | |
|---------------------------------------|---|--|--|--|
| Alarm / Relay x | Deactivated, instantaneous value, min/max-value, hold-value, totaliser value, sliding average value, constant value, difference between instantaneous value and constant value or an activation via the digital input or via the [O]-key. | | | |
| Switching threshold | Threshold / limit value of the change-over | | | |
| Hysteresis | Broadness of the window between the switching thresholds | | | |
| Working principle | Operating current / Quiescent current | | | |

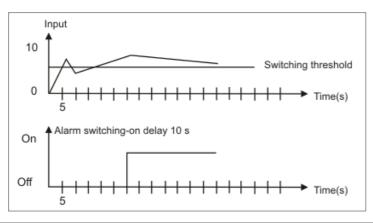

Operating current

By operating current, the alarm S1-S2 is **off** below the threshold and **on** on reaching the threshold.

Quiescent current

By quiescent current the alarm S1-S2 is **on** below the threshold and switched **off** on reaching the threshold.

Switching-on delay

The switching-on delay is activated via an alarm and e.g. switched 10 seconds after reaching the switching threshold, a short-term exceedance of the switching value does not cause an alarm, respectively does not cause a switching operation of the relay. The switching-off delay operates in the same way, keeps the alarm / the relay switched longer for the parameterised time.

8. Interfaces RS232 and RS485

Connection RS232

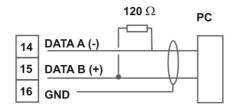

Digital device M3

PC - 9-pole Sub-D-plug

Connection RS485

Digital device M3

The interface **RS485** is connected via a screened data line with twisted wires (Twisted-Pair). On each end of the bus segment a termination of the bus lines needs to be connected. This is neccessary to ensure a secure data transfer to the bus. For this a resistance (120 Ohm) is interposed between the lines Data B (+) and Data A (–).

9. Programmer examples

Example for the rotation speed adjustment:

In this application the rotation speed of an axis shall be collected via a toothed wheel with 30 sprockets, per Namur sensor. It is then displayed with one position after decimal point and the dimension rpm.

| Parameter | Settings | Description |
|-----------|----------|--|
| LYPE | roLAr | Rotation – rotation speed measurement up to 10 kHz |
| | 30 | Number of sprockets |
| dob | | 1 position after decimal point |

Advice: The input frequency may be maximum 9.999 kHz in this operating module. So, a rotation speed parameterisation via the frequency adjustment is rarely necessary.

Example for the position coverage:

A measuring system for length works via an incremental encoder with two dephased output signals (typically A and B) and 100 pulse/rotation. The axis perimeter was calculated in a way that the measuring section can be extracted by a rotation of 6 cm = 60 mm. The display shall show the relative position in millimeter. There is a zero point position with a limit switch, that can zero the display if required.

| Parameter | Settings | Description |
|-----------|----------|-------------------------------|
| LYPE | Po5 1E | Positioning – rotary encoder |
| PPr | | Pulse number per rotation |
| End | 50 | Change of length per rotation |
| d 15. in | LALA | Display zero |

Advice: The display starts always on position zero. The parameter **DIG.IN** can be found under parameter group **-FLT-** in the extended parameterisation **PROF**.

Example for angle coverage:

On a manually operated bender for sheet metal the bending angle shall be displayed in degree. The device is in zero state (0°) during switching on of the display. An incremental encoder with 360 pulses/rotation is used.

| Parameter | Settings | Description |
|-----------|----------|------------------------------|
| LYPE | Po5 1E | Positioning – rotary encoder |
| PPr | 360 | Pulse number per rotation |
| End | 360 | Angle sum per rotation |

Examples: Adjustment according to number of sprockets at unknown rotation speed.

- nearly 100% of the rotation speeds are in the range of 0 to 30.000 r.p.m.
- the number of sprockets varies (without gearing) between 1 and 100
- in automation, the frequency supply never exceeds 10 kHz (rather 3 kHz)

Assume a rotation speed of 60 r.p.m. at 1 Hz, whereat the real frequency value will not be considered.

Our example complies with a number of sprockets of 64.

Setting up the advice

Based on the default settings of the display, the following parameters need to be changed:

| Parameter | Settings | Description |
|-----------|----------|---|
| LISPE | FLERU | Applying of the measuring signal is not applicable. |
| - R-GE | | Complies with 9.9999 Hz |
| End | <u> </u> | Assumed final value |
| EndR | 0.0064 | Complies with 64 sprockets |

If the frequency needs to be displayed with a position after decimal point, then a 60 has to be selected as final value for this adjustment.

| Parameter | Settings | Description |
|-----------|----------|---|
| LISPE | FLERU | Applying of the measuring signal is not applicable. |
| | III IE3 | Complies with 9.9999 Hz |
| End | 50 | Assumed final value |
| dob | | 1 position after decimal point |
| EndR | 0.0054 | Complies with 64 sprockets |

Example: Rotation speed of a machine shaft

There are 4 sprockets on one machine shaft. Applied in an angle of 90° to each other and to the rotation speed measurement. The sprockets are collected via a proximity switch and evaluated by the frequency device, which shall display the rotation speed in U/min.

0...3600 U/min is preset as rotation speed range of the machine.

Calculation of the input frequency

Number of sprockets = 4

Rotation speed = 3600 U/min

Final rotation speed
$$\left[\frac{U}{\min}\right]$$
Final frequency [Hz] = $\frac{S}{\min} x$ Number of sprockets

Final frequency [Hz] =
$$\frac{3600 \quad \frac{U}{\text{min}}}{60 \quad \frac{s}{\text{min}}} \times 4 = 240 \text{ Hz}$$

Setting up the device

Based on the default settings of the device, following parameters need to be changed:

| Parameter | Settings | Description |
|-----------|----------|---|
| LUPE | FLERU | As the input frequency is known, the device does not need to be applied to the measuring section. |
| -R-GE | IDDED | The final frequency is in the range of 100.00 to 999.99 Hz. |
| End | 3600 | A rotation speed of 3600 shall be displayed as final value. |
| EndR | 24000 | The final frequency for display value 3600 is 24.00 Hz. |

10. Technical data

| Housing | |
|------------------------|--|
| Dimensions | 96x48x120 mm (WxHxD) |
| | 96x48x139 mm (WxHxD) incl. plug-in terminal |

| CE-sign | Conformity to directive 2014/30/EU |
| | |
| Safety standard | According to low voltage directive 2014/35/EU EN 61010; EN 60664-1 |

11. Safety advices

Please read the following safety advices and the assembly *chapter 2* before installation and keep it for future reference.

Proper use

The **M3-1F-device** is designed for the evaluation and display of sensor signals.

Danger!

Careless use or improper operation can result in personal injury and/or cause damage to the equipment.

Control of the device

The panel meters are checked before dispatch and sent out in perfect condition. Should there be any visible damage, we recommend close examination of the packaging. Please inform the supplier immediately of any damage.

Installation

The **M3-1F-device** must be installed by a suitably **qualified specialist** (e.g. with a qualification in industrial electronics).

Notes on installation

- There must be no magnetic or electric fields in the vicinity of the device, e.g. due to transformers, mobile phones or electrostatic discharge.
- The fuse rating of the supply voltage should not exceed a value of 0.5A N.B. fuse!
- Do not install **inductive consumers** (relays, solenoid valves etc.) near the device and **suppress** any interference with the aid of RC spark extinguishing combinations or free-wheeling diodes.
- Keep input, output and supply lines separate from one another and do not lay them parallel with each other. Position "go" and "return lines" next to one another. Where possible use twisted pair. So, you receive best measuring results.
- Screen off and twist sensor lines. Do not lay current-carrying lines in the vicinity. Connect the **screening on one side** on a suitable potential equaliser (normally signal ground).
- The device is not suitable for installation in areas where there is a risk of explosion.
- Any electrical connection deviating from the connection diagram can endanger human life and/or can destroy the equipment.
- The terminal area of the devices is part of the service. Here electrostatic discharge needs to be avoided. Attention! High voltages can cause dangerous body currents.
- Galvanic isolated potentials within one complex need to be placed on an appropriate point (normally earth or machines ground). So, a lower disturbance sensibility against impacted energy can be reached and dangerous potentials, that can occur on long lines or due to faulty wiring, can be avoided.

12. Error elimination

| | Error description | Measures |
|----|---|--|
| 1. | The device shows a permanent overflow | The input frequency is too high for the selected frequency range. Correct RANGE according to this. Disturbing pulses lead to an increased input frequency, activate FI.FRQ at smaller frequencies or shield the senor line. A mechanic switching contact chatters. Activate the frequency filter FI.FRQ with 10 or 20 kHz. The display was taught faulty under TYPE = SENS.F. Error elimination see below. |
| 2. | The device shows a permanent underflow. | An offset frequency <i>DFFSR</i> bigger than 0 Hz respectively a "Living zero" was selected, in which no frequency is aligned. Check the sensor lines or set the <i>DFFSR</i> onto 0 Hz. The display underflow <i>DL.UND</i> was selected too high. The according parameter needs to be adapted. The device was taught faulty under <i>TYPE</i> = <i>SENS.F</i>. Error elimination see below. |
| 3. | The displayed values switches sporadical. | Disturbances lead to short-term display switches. For smaller frequences use the frequency filter FI.FRQ, select a higher measuring time or use the sliding averaging. The sprockets that needs to be collected are not evenly spread on a shaft or are not measured accurately. Use the sliding averaging "RVG" if necessary with the dynamic function STEP. The displayed value DISPL needs to be set on RVG. |
| 4. | The display remains on zero. | The sensor was not connected properly. Check the connection lines and if necessary the sensor supply. Best directly on the screw terminals of the device! A PNP- respectively NPN-output does not reach the required threshold. Check the voltage between terminal 2 and 3 with a multimeter. Depending on signal form it generally shoud be between 4 V and 15 V. The thresholds can be checked more savely with an oscilloscope. If necessary include an external pullup or pull-down. A Namur-sensor does not react. Check the distance between the sensor and the sprocket / survey mark and if necessary measure the voltage between 1 & 3. In open condition the input voltage needs to be smaller than 2.2 V and in active condition bigger than 4.6 V. The selected range of the input frequency is too high. Reduce the frequency range RRNGE to a smaller value. The activated frequency filter FI.FRQ suppresses the relevant pulses. Increase the filter frequency FI.FRQ or use the adaption of the key proportion FI.RRT. If this should not work, temporarily deactivate the frequency filter with FI.FRQ = NO. The device was taught faulty under TYPE = SENS.F. Change into TYPE / FREQU and preset the assumed frequency range RRNGE and the according initial and final values END, OFFS, ENDR, and OFFSR. Check this way, if a frequency signal was connected to the input. |
| 5. | The device shows <i>HELP</i> in the 7-segment display | The device located an error in the configuration memory, excecute a reset to the default values and set up the device according to your application. |
| 6. | Program numbers for the parameterisation of the input are not available | The programming interlock is activated. Enter correct code. |
| 7. | The device shows <i>ERR1</i> in the 7-segment display | Contact the manufacturer if errors of this kind occur. |
| 8. | The device does not react as expected. | • If you are not sure, if the device has been parameterised before, restore the state of delivery as described in <i>chapter 6</i> . |

M3_1FGB.pdf update: 30.01.2018
